## **DESCRIPTION**

The element Tungsten (W) is quite brittle and difficult to machine, but with the addition of nickel, copper and/or iron, a group of alloys are produced that are machinable with enhanced engineering properties. Designed to be used where a concentrated mass in a limited space is required, these heavy metal Tungsten Alloys are manufactured using powder metallurgy techniques to produce an alloy that is twice as heavy as steel and 50% more dense than lead. Overall their mechanical properties; hardness, tensile strength and ductility compare favorably to steel. These alloys also have an excellent oxidation resistance and can be plated or painted for enhanced corrosion protection.

## **APPLICATIONS**

Tungsten Alloys have found wide acceptance in applications such as aircraft counterbalance weights, gyro weights, down hole well logging casings and weights for the oil and gas industry, high energy radiation shielding for the medical and nuclear industry.
